## Project C: A Lens into an Interesting Galaxy

### Users Guide

W, A, S, D (forward, left, back, right) can be used to move the camera around the scene. The I, J, K, L keys change where the camera is pointing towards. The Q and E keys will fly the camera up and down, respectively depending on where the camera is pointing.

Using F, the world light can be turned off; using G, the lighting method is changed – by default it is Blinn-Phong lighting; using H will change the shading method. More information about the materials for the objects can be found in the console, which can be accessed through the shortcut “Ctrl + Shift + i” on PC or by “Command + Option + i” on Mac.

By changing the inputs in the editable boxes, the corresponding values will be changed and thus change the appearance of the lighting.

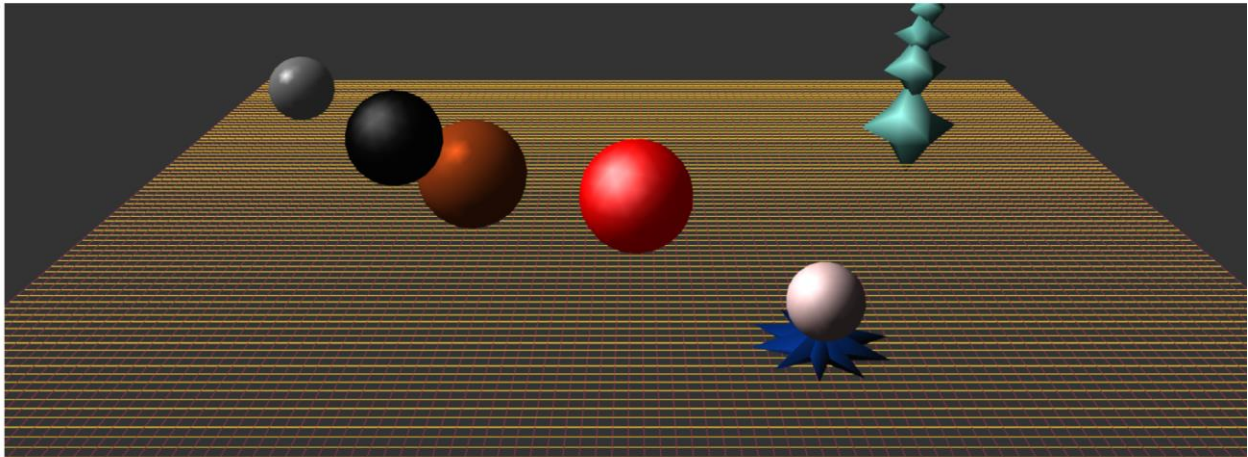

### Goals

- A) Create a large, animated 3D ‘world’ that users view and explore with an interactive movable 3D camera. One simple set of GUI controls (keyboard, possibly mouse) will aim the camera in any direction by adjusting compass-heading (rotate left/right) and the camera’s up/down rotation or ‘tilt’. Another set of GUI controls (probably arrow keys or WASD keys or similar set of 4) will move the camera forward or backward in the camera’s aiming direction, and will ‘strafe’ horizontally, moving side-to-side without changing the camera’s aiming direction or height above the ground-plane.
- B) Unlike Projects A and B, this ‘virtual world’ will no longer use cartoonish fixed colors at each vertex. It will instead compute colors in your vertex and fragment shader programs by simulating how a light source illuminates an oriented surface whose material reflects some fraction of that light towards the camera.
- C) The rigid 3D parts now MUST include a surface-normal attribute for each vertex, and a material descriptor that chooses a set of RGB reflectance values. Your GLSL shader programs will combine these reflectance values with RGB illumination values from 3D light sources in the virtual world to compute colors displayed on-screen.
- D) The program must use several vertex/fragment shader pairs (instead of one giant shader pair cluttered with conditionals) to compute the Phong and Blinn-Phong lighting model with both
  - a. ‘Gouraud’ shading (yields faceted appearance) and
  - b. ‘Phong’ shading (for smooth-looking, facet-free surfaces with nicely rounded specular highlights).

## Results

Light Mode: Blinn-Phong Lighting

Shader Mode: Gouraud Shading

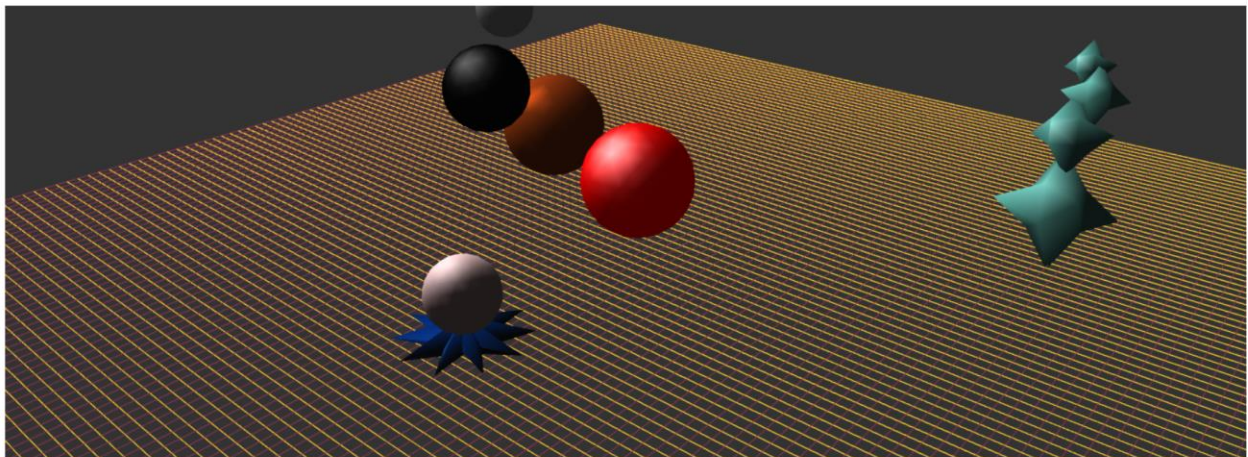

To look around the scene, use W, A, S, D to move the camera (forward, left, back, right), I, J, K, L to rotate where the camera is pointing towards, and Q and E to fly up and down (dependent on where the camera is pointing).

Figure 1

Figure 1 represents what the webpage looks like without any adjustments, i.e., the default state. It has Blinn-Phong lighting coupled with Gouraud shading as can be seen from the faceted appearance on the objects.

Light Mode: Blinn-Phong Lighting

Shader Mode: Gouraud Shading

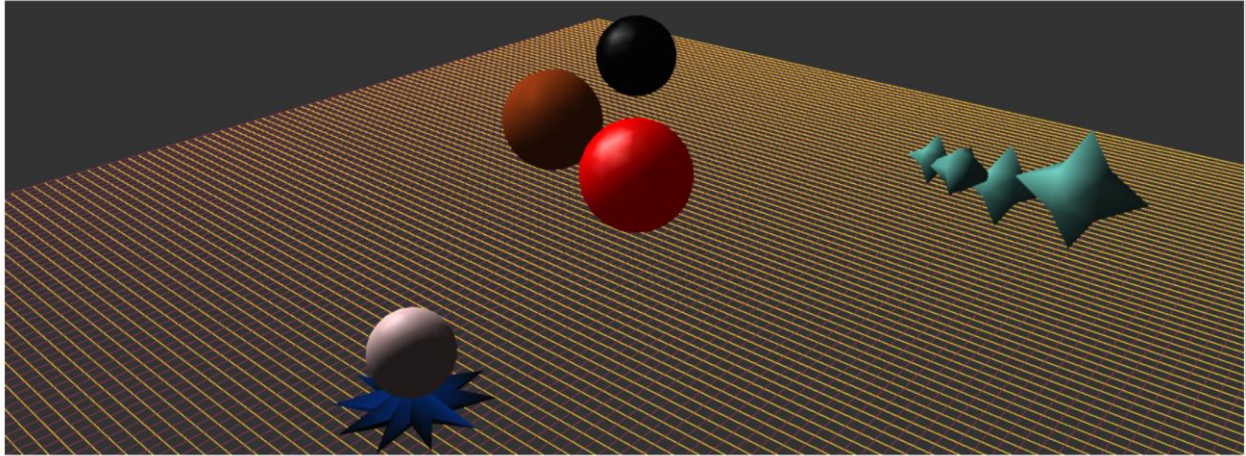

To look around the scene, use W, A, S, D to move the camera (forward, left, back, right), I, J, K, L to rotate where the camera is pointing towards, and Q and E to fly up and down (dependent on where the camera is pointing).

Figure 2

Figure 2 shows an example of the camera movement aspect, it also shows the animation aspect of the program.

Light Mode: Phong Lighting  
Shader Mode: Gouraud Shading

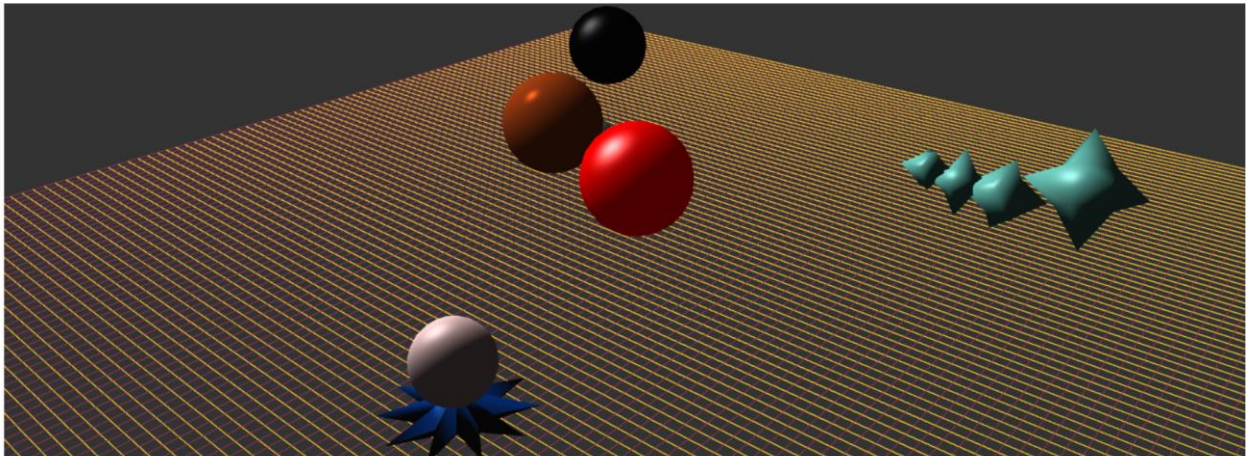

To look around the scene, use W, A, S, D to move the camera (forward, left, back, right), I, J, K, L to rotate where the camera is pointing towards, and Q and E to fly up and down (dependent on where the camera is pointing).

*Figure 3*

Figure 3 shows an example of Gouraud shading with Phong lighting. This can be seen from the still faceted appearance of the objects.

Light Mode: Phong Lighting  
Shader Mode: Phong Shading

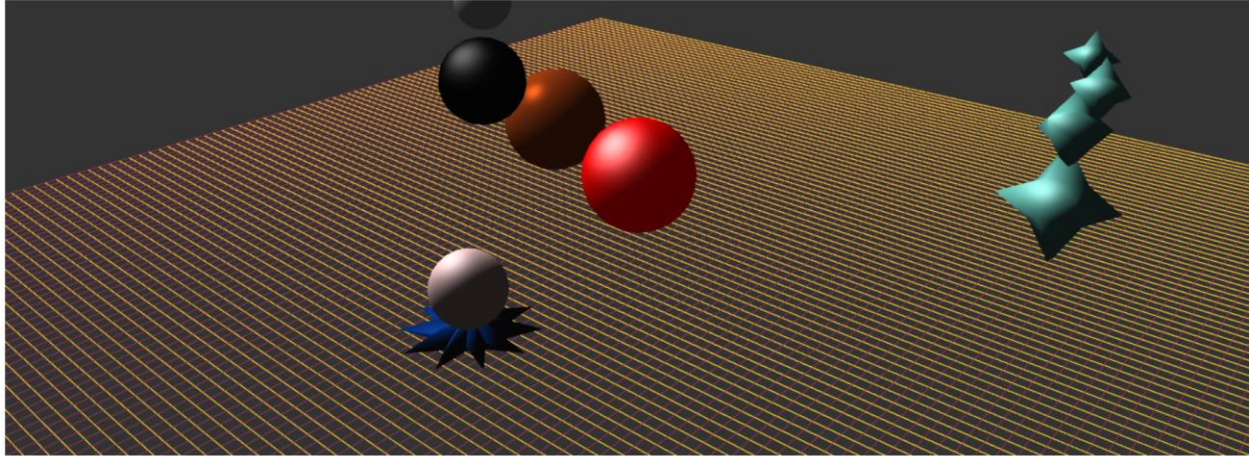

To look around the scene, use W, A, S, D to move the camera (forward, left, back, right), I, J, K, L to rotate where the camera is pointing towards, and Q and E to fly up and down (dependent on where the camera is pointing).

*Figure 4*

Figure 4 shows an example of Phong shading with Phong lighting. This can be seen from the “smooth-looking, facet-free surfaces with nicely rounded specular highlights.”

Light Mode: Blinn-Phong Lighting  
Shader Mode: Phong Shading

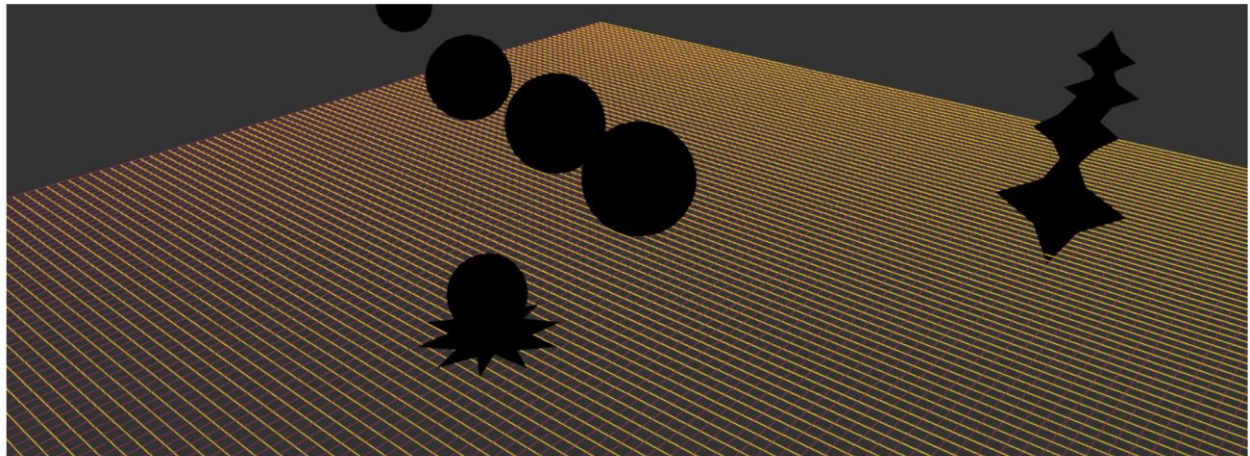

To look around the scene, use W, A, S, D to move the camera (forward, left, back, right), I, J, K, L to rotate where the camera is pointing towards, and Q and E to fly up and down (dependent on where the camera is pointing).

*Figure 5*

Figure 5 shows an example of Phong shading with Blinn-Phong lighting.

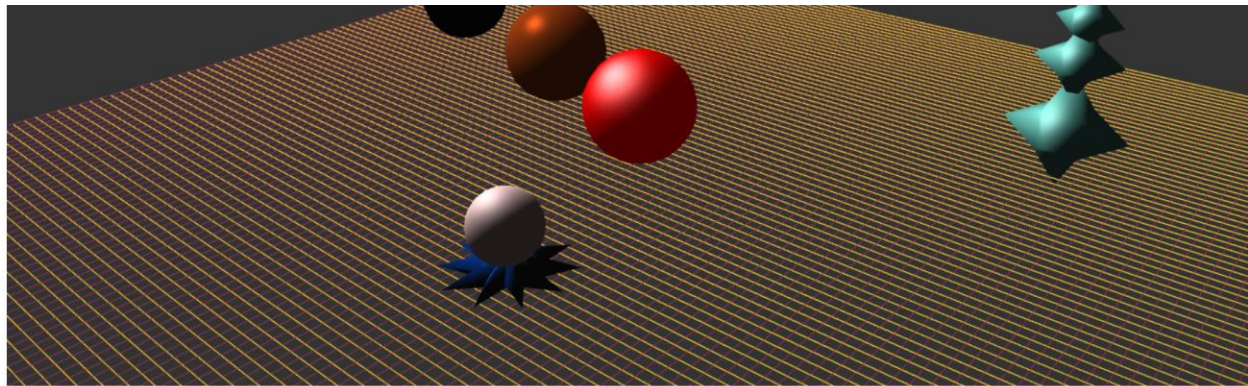

Light Mode: Blinn-Phong Lighting  
Shader Mode: Phong Shading

To look around the scene, use W, A, S, D to move the camera (forward, left, back, right), I, J, K, L to rotate where the camera is pointing towards, and Q and E to fly up and down (dependent on where the camera is pointing).

*Figure 6*

Figure 6 shows what the scene looks like when the world light is turned off.

To look around the scene, use W, A, S, D to move the camera (forward, left, back, right), I, J, K, L to rotate where the camera is pointing towards, and Q and E to fly up and down (dependent on where the camera is pointing).

Change the fields below to change the lighting

Ambient: R:	0.5	G:	0.5	B:	0.5
Diffuse: R:	1.0	G:	1.0	B:	1.0
Specular: R:	1.0	G:	1.0	B:	1.0
Position: X:	8.0	Y:	3.0	Z:	10.0

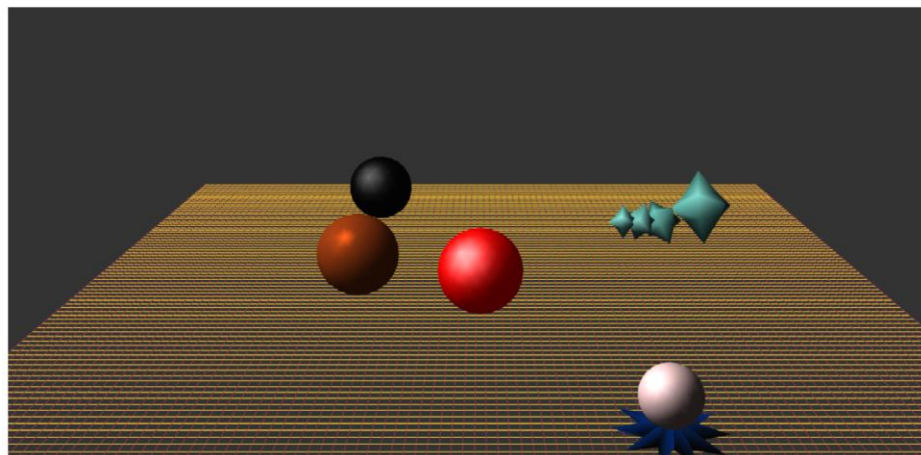

Use F to turn off the world light, G to change the lighting method, and H to change the shading method. For information about the materials used for the objects, see the console.

Figure 7

Figure 7 shows the controls, the editable values for the ambient, diffuse, and specular lighting, and the editable values for the position of the light source.

Light Mode: Blinn-Phong Lighting

Shader Mode: Gouraud Shading

To look around the scene, use W, A, S, D to move the camera (forward, left, back, right), I, J, K, L to rotate where the camera is pointing towards, and Q and E to fly up and down (dependent on where the camera is pointing).

```

The first sphere of the ProjC_OskayaOmer.js:172
orbiting spheres is made of 'shiny copper'.
The second sphere of ProjC_OskayaOmer.js:173
the orbiting spheres is made of 'rubber'.
The third sphere of the ProjC_OskayaOmer.js:174
orbiting sphere is made of 'chrome'.
The snake-like object ProjC_OskayaOmer.js:175
to the far right back of the scene is made of
'turquoise'.
The star below the ProjC_OskayaOmer.js:176
sphere is made of 'blue plastic'.
The sphere on top of ProjC_OskayaOmer.js:177
the star is made of 'pearl'.
myKeyUp()--keyCode=73 ProjC_OskayaOmer.js:1670
released.
myKeyUp()--keyCode=16 ProjC_OskayaOmer.js:1670
released.
myKeyUp()--keyCode=17 ProjC_OskayaOmer.js:1670
released.

```

Figure 8

Figure 8 shows the console output for the program. The material specifications can be found here.
